**Problem 1** (1.1)

(a) What values of  $\alpha$ , if any, yield  $f = O(\varepsilon^{\alpha})$  as  $\varepsilon \downarrow 0$  for each of the following functions?

(i)  $f = \sqrt{1 + \varepsilon^2}$ 

(v)  $f = \varepsilon \ln(\varepsilon)$ 

(ii)  $f = \varepsilon \sin(\varepsilon)$ 

(vi)  $f = \sin(1/\varepsilon)$ 

(iii)  $f = (1 - e^{\varepsilon})^{-1}$ 

(vii)  $f = \sqrt{x + \varepsilon}$ , where  $0 \ge x \ge 1$ 

(iv)  $f = \ln(1 + \varepsilon)$ 

(b) For the functions listed in (a), what values of  $\alpha$ , if any, yield  $f = o(\varepsilon^{\alpha})$  as  $\varepsilon \downarrow 0$ ?

Solution

(i) We can expand by plugging  $x^2$  into the Taylor series for  $\sqrt{1+x}$ :

$$f = \sqrt{1 + \varepsilon^2} = 1 + \frac{1}{2}\varepsilon^2 + o(\varepsilon^4).$$

Now, taking the ratio of limits we get,

$$\lim_{\varepsilon \downarrow 0} \frac{f}{\varepsilon^{\alpha}} = \lim_{\varepsilon \downarrow 0} \left( \varepsilon^{-\alpha} + \frac{1}{2} \varepsilon^{2-\alpha} + o(\varepsilon^{4-\alpha}) \right) = \begin{cases} \infty, & \alpha > 0 \\ 1, & \alpha = 0 \\ 0, & \alpha < 0 \end{cases}$$

Therefore,  $f=O(\varepsilon^{\alpha})$  for  $\alpha\leq 0$  and  $f=o(\varepsilon^{\alpha})$  for  $\alpha<0$ 

(ii) Now, we can expand sine into its Taylor series

$$f = \varepsilon \sin(\varepsilon) = \varepsilon \left(\varepsilon - \frac{\varepsilon^3}{3!} + o(\varepsilon^5)\right) = \varepsilon^2 - \frac{\varepsilon^4}{3!} + o(\varepsilon^5)$$

For similar reasons as above, we have that  $f = O(\varepsilon^{\alpha})$  and  $f = o(\varepsilon^{\alpha})$  for  $\alpha \leq 2$ .

(iii) For this, we can use another Taylor series truncation  $e^x = 1 + x + o(x^2)$ 

Problem 2 (1.3)

This problem establishes some of the basic properties of the order symbols, some of which are used extensively in this book. The limit assumed here is  $\varepsilon \downarrow 0$ .

Math 207C Homework Ian Gallagher

(a) If f = o(g) and g = O(h), or if f = O(g) and g = o(h), then show that f = o(h). Note that this result can be written as o(O(h)) = O(o(h)) = o(h).

- (b) Assuming  $f = O(\phi_1)$  and  $g = O(\phi_2)$ , show that  $f + g = O(|\phi_1| + |\phi_2|)$ . Also, explain why the absolute signs are necessary. Note that this result can be written as O(f) + O(g) = O(|f| + |g|).
- (c) Assuming  $f = O(\phi_1)$  and  $g = O(\phi_2)$ , show that  $fg = O(\phi_1\phi_2)$ . This result can be written as O(f)O(g) = O(fg).
- (d) Show that O(O(f)) = O(f).
- (e) Show that O(f)o(g) = o(f)o(g) = o(fg).

### Solution

(a) For the first case, the following holds for all  $\delta_1$  and some constants  $C, \varepsilon_1, \varepsilon_2$ 

$$|f(\varepsilon)| \leq \delta_1 |g(\varepsilon)|$$
, for  $0 < \varepsilon < \varepsilon_1$ 

and

$$|g(\varepsilon)| \le C|h(\varepsilon)|$$
, for  $0 < \varepsilon < \varepsilon_2$ 

Therefore,

$$|f(\varepsilon)| \le \delta |h(\varepsilon)|$$
, for  $0 < \varepsilon < \min\{\varepsilon_1, \varepsilon_2\}$ 

where  $\delta = C\delta_1$ . Since  $\delta_1$  is arbitrary, for any  $\delta > 0$ , we can set  $\delta_1 = \delta/C$  and we may conclude that f = o(h).

Similarly, for all  $\delta'_1$  and some constants  $C', \varepsilon'_1, \varepsilon'_2$ 

$$|f(\varepsilon)| \le C'|g(\varepsilon)|$$
, for  $0 < \varepsilon < \varepsilon'_1$ 

and

$$|g(\varepsilon)| \le \delta_1' |h(\varepsilon)|$$
, for  $0 < \varepsilon < \varepsilon_2'$ 

Therefore,

$$|f(\varepsilon)| \leq \delta' |h(\varepsilon)|$$
, for  $0 < \varepsilon < \min\{\varepsilon'_1, \varepsilon'_2\}$ 

where  $\delta' = C'\delta'_1$  and we may conclude that f = o(h) in the same way.

(b) Assuming  $f = O(\phi_1), g = O(\phi_2)$ , there exists constants  $C_1, C_2, \varepsilon_1, \varepsilon_2$  such that

$$|f(\varepsilon)| \le C_1 |\phi_1(\varepsilon)|, 0 < \varepsilon < \varepsilon_1$$
  
 $|g(\varepsilon)| \le C_2 |\phi_2(\varepsilon)|, 0 < \varepsilon < \varepsilon_2$ 

Therefore,

$$|(f+g)(\varepsilon)| = |f(\varepsilon) + g(\varepsilon)|$$

$$\leq |f(\varepsilon)| + |g(\varepsilon)|$$

$$\leq C_1|\phi_1(\varepsilon)| + C_2|\phi_2(\varepsilon)|$$

$$\leq C(|\phi_1(\varepsilon)| + |\phi_2(\varepsilon)|)$$

holds for  $C = \max\{C_1, C_2\}$  and  $0 < \varepsilon < \min\{\varepsilon_1, \varepsilon_2\}$ . Therefore,  $f + g = O(|\phi_1| + |\phi_2|)$ . The necessity of the absolute values are evident from the last inequality.

Math 207C Homework Ian Gallagher

#### Problem 3

1.5 Suppose  $f = o(\phi)$  for small  $\varepsilon$ , where f and  $\phi$  are continuous.

(a) Give an example to show that it is not necessarily true that

$$\int_0^{\varepsilon} f d\varepsilon = o\left(\int_0^{\varepsilon} \phi d\varepsilon\right).$$

(b) Show that

$$\int_0^\varepsilon f \mathrm{d}\varepsilon = o\left(\int_0^\varepsilon |\phi| \mathrm{d}\varepsilon\right).$$

## **Problem 4** (1.7)

Assuming  $f \sim a_1 \varepsilon^{\alpha} + a_2 \varepsilon^{\beta} + \cdots$ , find  $\alpha, \beta$  (with  $\alpha < \beta$ ) and nonzero  $a_1, a_2$  for the following functions:

(a) 
$$f = \frac{1}{1 - e^{\varepsilon}}$$
.

(b) 
$$f = \left[1 + \frac{1}{\cos(\varepsilon)}\right]^{\frac{3}{2}}$$
.

(c) 
$$f = 1 + \varepsilon - 2\ln(1 + \varepsilon) - \frac{1}{1 + \varepsilon}$$

(d) 
$$f = \sinh(\sqrt{1 + \varepsilon x})$$
, for  $0 < x < \infty$ .

(e) 
$$f = (1 + \varepsilon x)^{\frac{1}{\varepsilon}}$$
, for  $0 < x < \infty$ .

(f) 
$$f = \int_0^{\varepsilon} \sin(x + \varepsilon x^2) dx$$
.

(g) 
$$f = \sum_{n=1}^{\infty} \left(\frac{1}{2}\right)^n \sin\left(\frac{\varepsilon}{n}\right)$$
.

(h) 
$$\int_0^{\varepsilon} \sin(x + \varepsilon x^2) dx$$
.

(i) 
$$f = \int_0^1 \frac{\mathrm{d}x}{\varepsilon + x(x-1)}$$
.

## **Problem 5** (1.18)

Find a two-term asymptotic expansion, for small  $\varepsilon$ , of each solution x of the following equations:

(a) 
$$x^2 + x - \varepsilon = 0$$

(e) 
$$\varepsilon x^3 - x + \varepsilon = 0$$

(h) 
$$x^2 + \varepsilon \sqrt{2+x} = \cos(\varepsilon)$$

(p) 
$$xe^{-x} = \varepsilon$$

#### **Problem 6** (1.19)

This problem considers the equation  $1 + \sqrt{x^2 + \varepsilon} = e^x$ .

- (a) Explain why there is one real root for small  $\varepsilon$ .
- (b) Find a two-term expansion of the root.

# **Problem 7** (1.20)

In this problem you should sketch the functions in each equation and then use this to determine the number

Math 207C Homework

Ian Gallagher

and approximate location of the real-valued solutions. With this, find a three-term asymptotic expansion, for small  $\varepsilon$ , of the nonzero solutions.

- (a)  $x = \tanh\left(\frac{x}{\varepsilon}\right)$ ,
- (b)  $x = \tan\left(\frac{x}{\varepsilon}\right)$ .

# **Problem 8** (1.21)

To determine the natural frequencies of an elastic string, one is faced with solving the equation  $tan(\lambda) = \lambda$ .

- (a) After sketching the two functions in this equation on the same graph explain why there is an infinite number of solutions.
- (b) To find an asymptotic expansion of the large solutions of the equation, assume that  $\lambda \sim \varepsilon^{-\alpha}(\lambda_0 + \varepsilon^{\beta}\lambda_1$ . Find  $\varepsilon, \alpha, \beta, \lambda_0, \lambda_1$  (note that  $\lambda_0$  and  $\lambda_1$  are nonzero and  $\beta > 0$ ).
